

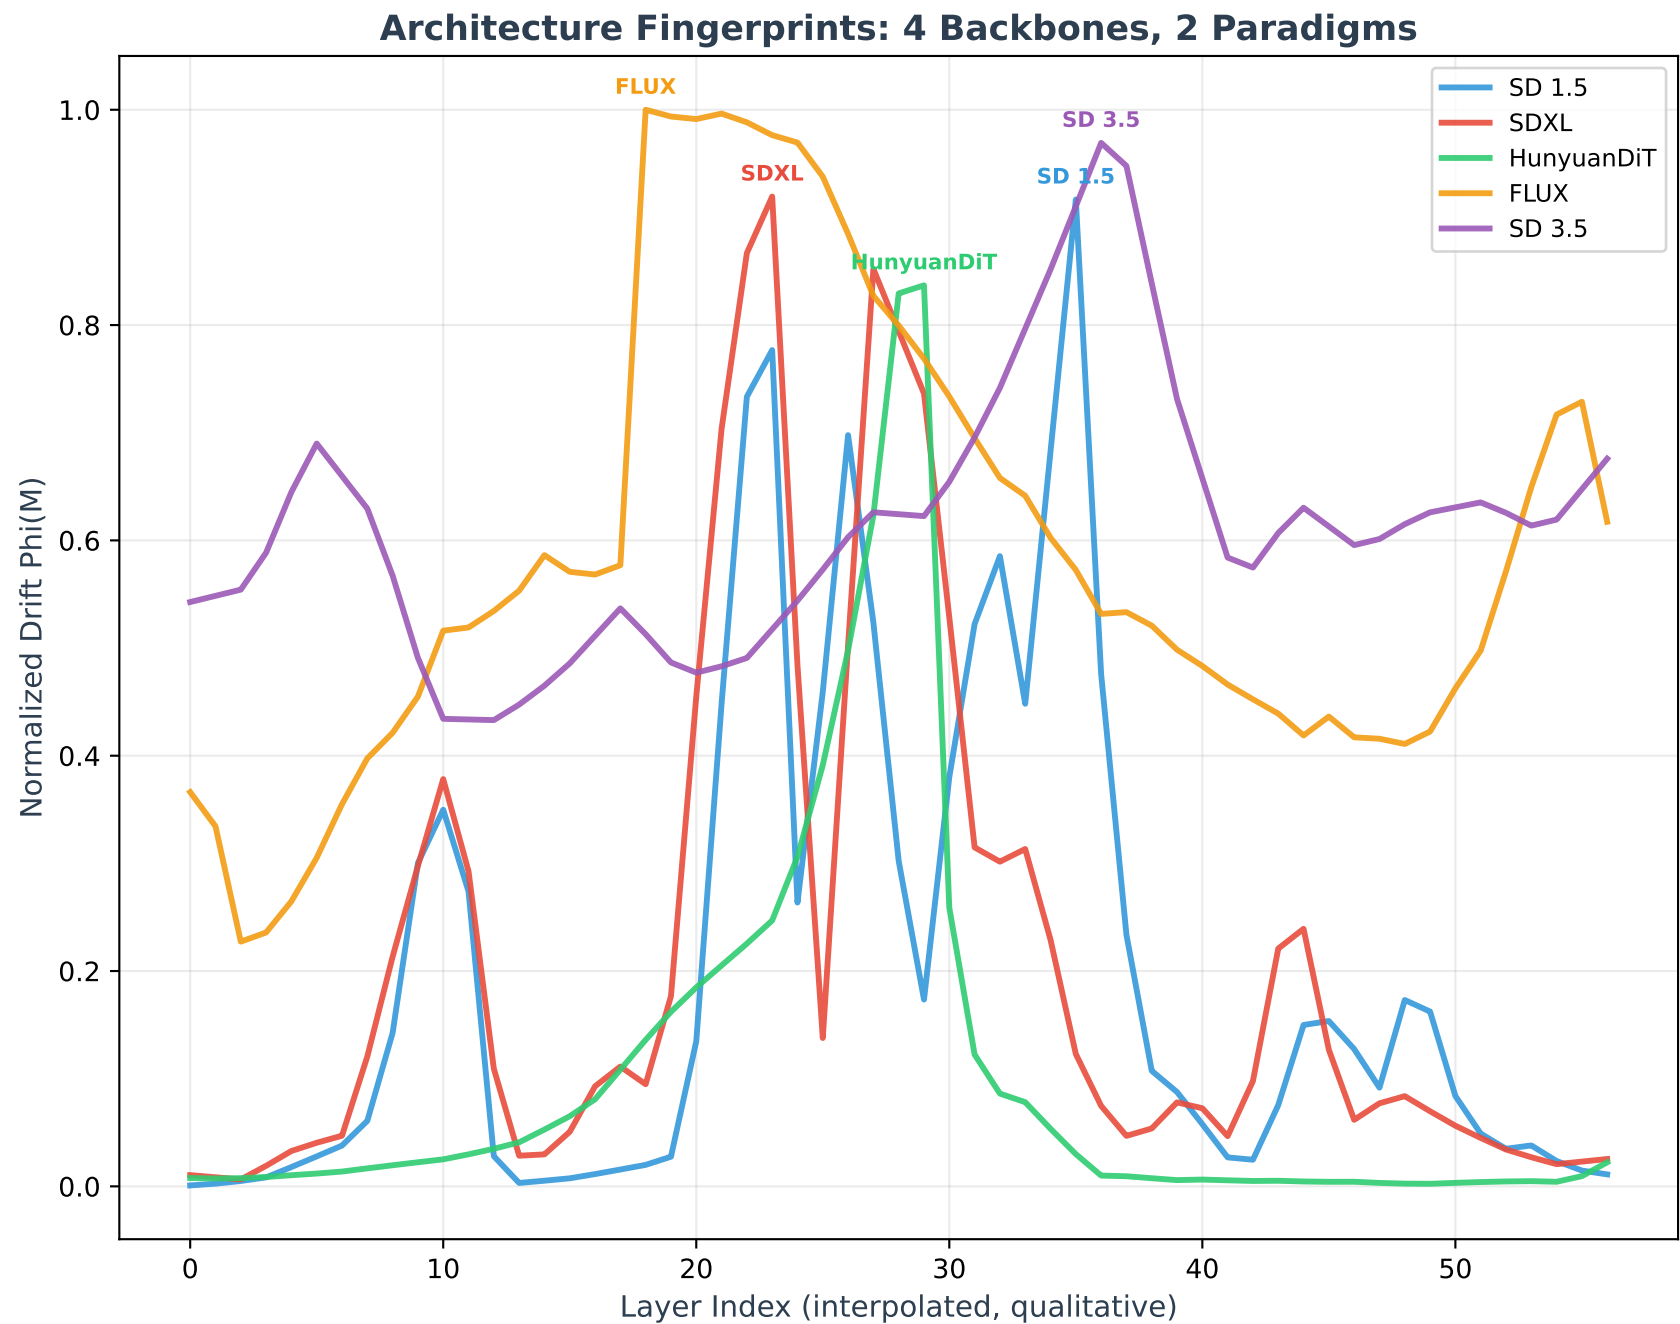

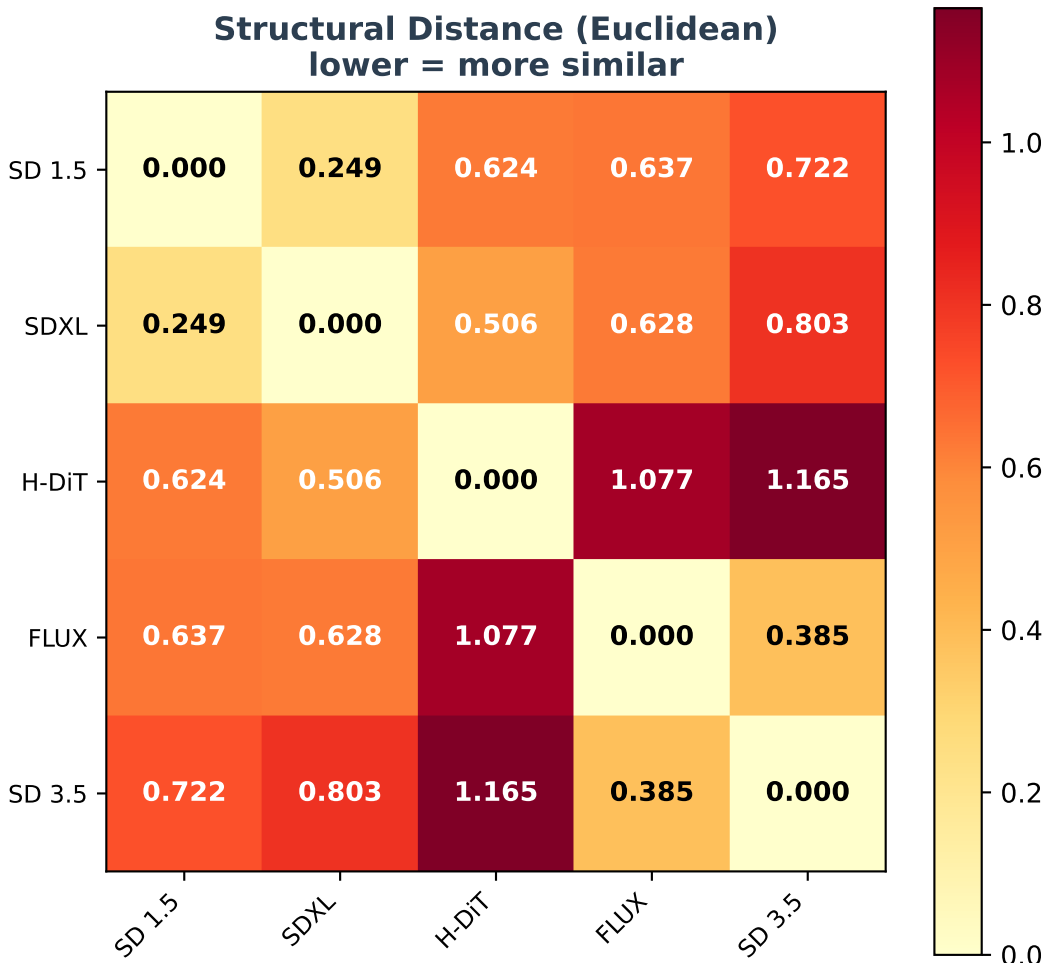

Figure 2: Architecture Fingerprint -- Phi(M) is reproducible, architecture-specific

(qualitative overlay -- interpolation for visual alignment only)

Panel B: Structural distance computed from 4 raw-layer-count features (peak position, modality, drift concentration, spread) -- NO interpolation. SD 1.5--SDXL $d=0.045$ (same UNet family); SDXL--DiT $d=0.620$ (different backbones).
